

SoMono Control

Control is a controller bank. It can be used to control multiple parameters on multiple machines (up to 8 different parameters). Simply drag and drop from the appropriate control output to the slider you want to control. The intended use for this machine is to have a single machine that you can assign MIDI controller knobs to and control many aspects of your song while only having to insert a single long pattern in the sequencer view. I use it this way - compose a song or simply decide how long it will be, make a Control pattern slightly longer than that, assign MIDI controller knobs to the "Value" sliders in the machine, add said pattern to the sequencer view, assign outputs to parameters of other machines that I want to control, press record, twiddle the knobs, repeat until results are satisfactory.

Parameter	Min	Max	Units	Meaning
Value	0.0	1.0	Float	Slider value, before any post processing.
Power	-5.0	5.0	Float	Apply non-linear processing to the slider value of specified strength.
Min	0.0	1.0	Float	Minimum value the output can reach.
Max	0.0	1.0	Float	Maximum value the output can reach.
